1. Annualized premiums are calculated by using multipliers for various premium payment terms to the premium per payment. In single premium contracts, the amount is calculated by dividing the premium by the duration of the policy.
2. Annualized premiums for medical and survival benefits include (a) premium related to medical benefits such as hospitalization and surgery benefits, (b) premium related to survival benefits such as specific illness and nursing benefits, and (c) premium related to premium waiver benefits, in which disability cause is excluded but causes such as specific illness and nursing care are included.

Supplementary Explanation

< Calculation of returns >

The calculation methods of “Return on investments (income base)”, “Return on investments (realized base)” and “Total return based on the fair value” are as follows.

1. Return on investments (income base)

The results of investment activities are shown from the point of view of income earned (interest and dividend income earned).

Numerator is based on interest and dividend income related to investment assets. Denominator is based on cost of investment assets.

Numerator = Interest and dividend income (including amounts which correspond to interest and dividend income of investment gains and losses on money trusts)

Denominator = Average balances of investment assets based on the cost or the amortized cost

2. Return on investments (realized base)

The results of investment activities are shown from the point of view of the contribution to periodic gains and losses of the period (statement of income).

Numerator is based on realized gains and losses. Denominator is based on cost of investment assets.

Numerator = Investment income + Interest and dividend income on deposits of premiums, etc. - Investment expenses

Denominator = Average balances of investment assets based on the cost or the amortized cost

3. Total return based on the fair value (reference)

The return on investment based on fair value is shown.

Numerator is based on realized gains and losses and changes in unrealized gains and losses on investment assets.

Denominator is based on fair value of investment assets.

Numerator = (Investment income + Interest and dividend income on deposits of premiums, etc. - Investment expenses) + (Unrealized gains and losses at the end of this period* - Unrealized gains and losses at the end of the previous period*) + Increase or decrease in deferred gains and losses on hedges

Denominator = Average balances of investment assets based on the cost or the amortized cost + Unrealized gains and losses at the end of the previous period* + Unrealized gains and losses on trading securities at the end of the previous period

*Unrealized gains and losses relate to securities available for sale, monetary receivables bought and money trusts classified as other than trading purposes or held to maturity. The amount is based on before tax effect deductions.

< Calculation of ratios, etc. >

- Underwriting profit = Underwriting income - Underwriting expenses - Operating, general and administrative expenses related to underwriting + Other income and expenses*

*Other income and expenses include, but not limited to, income tax expenses for compulsory automobile liability insurance.

- Net loss ratio = (Net claims paid + Loss adjustment expenses) / Net premiums written × 100
- Net operating expenses ratio = (Net commissions and brokerage fees + Operating, general and administrative expenses related to underwriting) / Net premiums written × 100
- Combined ratio = Net loss ratio + Net operating expenses ratio

- $E/I^{(Note1)} \text{ loss ratio} = (\text{Net claims paid} + \text{Reserve for outstanding losses and claims at the end of this period} - \text{Reserve for outstanding losses and claims at the end of the previous period} + \text{Loss adjustment expenses}) / \text{Net earned premiums}^{(Note2)} \times 100$

Notes)

1. E/I loss ratio is calculated by excluding household earthquake insurance and compulsory automobile liability insurance.
 2. Net earned premiums = Net premiums written - Unearned premium at the end of this period
+ Unearned premium at the end of the previous period
- E/I Combined ratio = E/I loss ratio + Operating expenses ratio

< Non-consolidated solvency margin ratio >

- In addition to reserves to cover payments for claims, benefits and maturity refunds, etc., it is necessary for insurance companies to maintain sufficient solvency in order to cover against risks which exceed their normal estimates, i.e. occurrence of major catastrophes, fluctuation in mortality rate due to significant changes in key environmental factors and big decline in value of assets held by insurance companies.

- (C) Non-consolidated Solvency Margin Ratio, which is calculated in accordance with the Insurance Business Act, etc. is the ratio of “solvency margin of insurance companies by means of their capital, reserves, etc.” ((A) Total Non-consolidated Solvency Margin) to “risks which exceed their normal estimates” ((B) Total Non-consolidated Risks).

- “Risks which exceed their normal estimates” are composed of risks described below.

<1> Underwriting risk, Underwriting risk for third-sector insurance products including accident, sickness and nursing-care insurance:

Risks of rate of occurrence of insurance claims, etc. in excess of normal estimates (excluding risks relating to major catastrophes)

<2> Guaranteed interest rate risk:

Risks of invested assets failing to yield assumed interest rates due to the aggravation of investment conditions

<3> Investment risk:

Risks of securities and other assets held fluctuating in prices in excess of normal estimates

<4> Business management risk:

Risks beyond normal estimates arising from business management that do not fall under other categories

<5> Major catastrophe risk:

Risks of the occurrence of major catastrophic losses in excess of normal estimates (risks such as the Great Kanto Earthquake or Isewan Typhoon)

<6> Guaranteed minimum benefit risk:

Risks of special account assets fluctuating in prices in excess of normal estimates

- “Solvency margin of insurance companies by means of their capital, reserves, etc.” (total non-consolidated solvency margin) is the sum of total net assets (excluding planned outflows), certain reserves (reserve for price fluctuation, contingency reserve and catastrophic loss reserve, etc.) and parts of unrealized gains and losses on land, etc.

- Solvency margin ratio is one of the indicators for the regulatory authorities to monitor financial soundness of insurance companies. Solvency margin ratio exceeding 200% would indicate adequate capability to meet payments of possible insurance claims and others.

< Adjusted consolidated profit >

(Japanese GAAP)

		Calculation method
Adjusted profit by business segment (Note 1)	Domestic P&C Insurance Business	Net income for the period + Provisions for catastrophic loss reserve, etc. (after tax) + Provisions for reserve for price fluctuation (after tax) – Gains/losses on sales of securities and impairment losses on securities (after tax)
	Overseas Insurance Business	Operating income (Note 2) Net income for the period for affiliates accounted for under the equity-method in principle
	Domestic Life Insurance Business	Net income for the period + Provisions of contingency reserve (after tax) + Provisions for reserve for price fluctuation (after tax) + Adjustment of underwriting reserve (after tax) + Deferral of acquisition cost (after tax) – Depreciation of acquisition cost (after tax) – Gains/losses on sales of securities and impairment losses on securities (after tax) – Reinsurance effect of surplus relief (after tax)
	Nursing Care Business	Net income for the period
	Digital & Others	Net income for the period – Gains/losses and impairment losses on investment (after tax)
Adjusted consolidated profit		Total of adjusted profit by business segment
